

YEAR	AUTHOR	OBJECTIVE	LIMITATIONS
2017	Mr.Pierpaolo dondio	Cross industry standard process(CRISP) Methodology(Azevdo 2008) was followed in research. Business understanding, data understanding, data preparation, modelling, evaluation and deployment.The principle objective of the research is to help the students who are aspiring to pursue their education in the USA. The SAP system will help them to evaluate the chances of the success in the particular university without being depended on any education consultancy firm . It will help them in saving a huge amount of time and money spent in the application process.	Student admission predictor system will only take into consideration the data related to the Indian students pursuing masters in computer science from universities in the USA.
2020	Amal AlGhamdi.et Al	Graduate Admission Prediction by using Machine Learning approach to automatically predict the possibility of postgraduate admission to help graduates recognizing and targeting the universities which are best suitable for their profile that three learning strategies of regression to predict the university rate given the students' profile; namely, linear regression, decision tree, and logistic regression model. These models select the best model in terms of the highest accuracy rate and the least error. Logistic Regression model shows the most accurate prediction in our experiments.	This limits the users by giving very few information where only name, course and few criteria could be only shown.
2020	Sujay S	Graduate Admission Prediction using Machine learning algorithm,Python and Exploratory Data Analysis that is used to analyse and predict the possibility of a person getting an admission. This can be done by implementing the Linear Regression which is one of the famous statistical methods in linear algebra. After implementing immense research on the dataset, explore the relationship between each factor which contributes in one or the other way to get an admit.	This could be less accurate while performing.

2020	Mr. Jubail	<p>Earlier student performance prediction can help decision makers to provide needed actions at the right movement. and to planning the appropriate training order to improve the student rate several studies have been published in using data mining methods to predict students academic success. One can observe several levels targeted.~Degree Level~Year LevelCourse Level~Exam Level.In this study literature related to exam level is excluded as the outcome of single exam does not necessarily imply a negative outcome. Earlier student performance prediction can help universities to provide timely action, like planning for appropriate training to improve students success gate.</p>	Despite the many dedicated softwares this is still not a straight forward process, involving many directions.
2021	Jeevan Ratnakar K.et.al	<p>Graduate Admission prediction using Machine Learning. A comparative approach by developing four machine learning regression models: linear regression, support vector machine, decision tree and random forest for predictive analytics of graduate admission chances. Newly graduate students usually are not knowledgeable of the requirements and the procedures of the postgraduate admission and might spend a considerable amount of money to get advice from consultancy organisations to help them identify their admission chances.</p>	This could be less accurate while performing.
2021	Dr. Arunakumari B.et Al	<p>Automated Web Application Prediction Model for a college admission system that can be used for judicious college selection before the allotment. system is developed considering K-CET. Similarly, this system can be used for the Common Entrance Tests of other states. A method that will support an organisation to explore the current scenario of student enrollment by predicting student enrollment behaviour.</p>	This website cannot accurately predict the universities which are in top need according to the marks.
